

Certificates as a service. How digitalization can change how we can approach training: Virtual Training Platform for offshore wind and maritime

Kristian Andreasen / CEO and Founder | Kanda

Business is booming in the South Asian region and not least in the maritime and offshore sectors. Ambitions are high as offshore wind farms and shipyards are being built at an ever-increasing speed. The question is, who will train the people installing, operating, and maintaining these complex installations and technologies being developed these years?

In this talk, the CEO and founder of the Danish software company Kanda, Kristian Andreasen, will highlight some of the benefits of transforming traditional onsite training into immersive digital learning applications that enable hands-on training and teamwork across platforms and physical boundaries.

With Kanda's Virtual Training Platform, employees can access the standard courses required in the maritime and offshore sector, wherever they are and as often as they want. It's easy to access, highly affordable, certified to industry standards, and has a flexible subscription. We call it 'Certificates as a service.'
